Solutions for modern Farming

CATTLE BRUSHES A perfect solution to increase production...

The use of brushes in animal production sites is the ideal solution to reduce the presence of bacteria in the animal skin, reducing the risks of diseases. Together with this benefit, the skin brushing process results in an increase of milk production.

Modern agriculture includes taking care of cattle in several different ways. Osborn cattle brushes help to keep animals clean and also produce a sense of pleasure for the animals.

Cattle brushes provide comfort, hygiene and peace besides that they contribute significantly to a healthy and happy livestock. Brushes are large, slow rotating round brushes, which are mounted in the stable. Animals are clearly happy to brush against these, to relieve itch or to give their hide a blissful brushing. The animals are calmed down, their wellbeing is increased.

We can produce brushes for all brushing equipment on the market such as Lely, Delaval, Schurr, Heido, Mayer., and according to your requirements. We recommend changing cattle brushes every 2-3 years.

Brushes apparently may seem in good conditions but most probably fiber properties have lost their quality basically due to use and changes in the weather and temperature, so the effect on the animal is not the same as that of a new brush.

Best production results
suitable for different animals:

Cow Milk Production Pig's Meat Production

Production increase by:

- 1L a day / each cow
- Animal health level increase 34%

(less disease risks)

According to a field study made by Cornell University shows that second lactation cows demonstrated a significant increase in daily milk production and a decrease in clinical mastitis when a cow brush was installed.
